An Introduction to Bicomponent Fibers. Since 1971, Hills, Inc. has specialized in the design, development, and manufacture of technically advanced, custom fiber production equipment. One of our areas of specialization has been in the field of bicomponent fiber equipment, processes, and products. While concepts and limited commercial uses of bicomponent have been in the industry for several decades, the complexity, cost and limited production rates of the earlier fiber extrusion equipment ...

Bicomponent Fibers Hills

A bicomponent fiber is made of two materials, utilizing desired properties of each material. Such fibers can be created by extrusion spinning. One or both materials may remain in the finished product, or one material may be dissolved, leaving only one material remaining. For example, DuPont created the highly coiled elastic fiber called cantrese having two different nylon polymers side-by-side.

Bicomponent fiber - Wikipedia

A bicomponent fiber is spun from two or more polymers extruded from one spinneret to form a single fiber. Typical bicomponent cross sections are core – sheath, side by side, and multiple core configurations. Core – sheath types are commonly used as binder fibers for nonwovens, side by side to design self crimping yarns, and multiple cores to

YARNS.** Bicomponent yarns describe
filament yarns which consist of two different
polymers. Those polymers can be
embedded in various ways: for example by

combination of polymers, bicomponent
yarns have the properties of both polymers,
enabling them to be applied in a range of
applications like adhesion melting.

Bicomponent Fibers and its Applications

The term bicomponent fiber, also known as a conjugate fiber, refers to a single fiber that includes two varied polymer components inside the same filament. The production of bicomponent fibers is not a new concept - Dupont already introduced this idea in the mid 1960s. However, the processes used to produce bicomponent fibers were not streamlined, which recently led to the development of new material systems and their manufacturing technologies.

For the bicomponent fibers, the mean polymer density $\bar{\rho}$, i.e. the quotient of the sum of the partial masses of core and sheath (m_c and m_s) and the total volume V_{tot} , was calculated according to the following equation: (1)

$$\bar{\rho} = \frac{m_c + m_s}{V_c + V_s} = \frac{\rho_c V_c + \rho_s V_s}{V_c + V_s}$$
