Bio/muco-adhesive systems: bind to the gastric epithelial cell surface or mucin, which extends the GRT of drug delivery system in the stomach. The ability to provide adhesion of a drug delivery system to the gastrointestinal wall provides longer residence time in a particular organ site, thereby producing an improved effect in terms of local action or systemic effect. Binding of polymers to the mucin/epithelial surface can be divided into three categories: 1.

Bioadhesion at exposed epithelial surface
Bioadhesion at exposed epithelial surface::
o Maintains continuity of mucous layer
o Provides a protective covering for the underlying cell layers from physical and chemical stress.
o Acts as a platform for drug delivery to local tissues and facilitates recovery of the damaged or diseased cell layers. e.g. Sucralfate, adhere selectively to ulcer and eroded surface of epithelial cell by electrostatic attraction

Conventional drug delivery systems are known to provide an immediate release of drug, in which one can not control the release of the drug and can not maintain effective concentration at the target site for longer time. Controlled drug delivery systems offer spatial control over the drug release. Osmotic pumps are most promising systems for controlled drug delivery.
