The Client/Server model is basically platform independent and blends with "cooperating processing" or "peer-to-peer" model. The platform provides the opportunity for users to access the business functionality thereby exposing into risky situations since its transparent to the underlying technology aswell as to the user.

Client/Server Architecture: Introduction to Client/Server ...

Introduction. A client/server application is a computer program that allows a user to access something that is stored in a server. Of course, both computers can be workstations and can run the same type of operating system. In most networking environments, the server holds a database and users must access that database from their workstations. If you want to create a client/server database application, you have many choices among Microsoft Access, XML, file processing, MySQL, Oracle, etc.

Introduction to Client/Server Architecture. In the Oracle database system environment, the database application and the database are separated into two parts: a front-end or clientportion, and a back-end or serverportion—hence the term client/server architecture. The client runs the database application that accesses database information and interacts with a user through the keyboard, screen, and pointing device, such as a mouse.
